

Study Guide

Study Guide

Key Concepts to Review:

- **Descriptive Statistics**

- Understand how these statistics summarize, organize, and describe data.
- Review measures like mean, median, mode, and range.
- Know their uses in psychology research.

- **Inferential Statistics**

- Learn how populations and samples lead to conclusions.
- Understand the basics of statistical inference.

- **Sample vs Population**

- Differentiate a sample from a population.
- Know why representative samples are important.

- **Jamovi Software Basics**

- Review Jamovi's purpose: statistical calculations & visualizations.
- Practice opening Jamovi, importing datasets, and identifying variable types (nominal, ordinal, integer, continuous).
- Try classifying variables in at least one demo dataset.

- **Variable Types**

- Define and give examples for nominal, ordinal, integer, continuous.
- Practice types by matching variables (e.g., age, gender, income) to categories.

- **Identifying & Matching Variables**

- Recognize variable types in datasets and understand why type matters for analysis.

- **Choosing Appropriate Graphs**

- Know which graphs to use for different variables in Jamovi (bar, histogram, pie, line).

- Practice graphing a simple variable.
 - **Case Studies & Application**
 - If given a scenario, identify descriptive vs inferential statistics.
 - Practice spot-checking Jamovi outputs (e.g., is a variable misclassified? Does output match variable type?).
 - **Jamovi Output Interpretation**
 - Review screenshots of Jamovi's UI.
 - Look for common mistakes in output—misclassified variables, wrong graphs, errors in tables.
-

Study Tips:

- Go through chapters 1–3 and Jamovi exercises.
- Practice basic Jamovi analyses.
- Remember: 30-minute time limit; practice for speed!
